

Challenge - Laravel

For this challenge you need to create a forum.

Users can register on the forum with a username, email and password.

All users have the role `user` by default. There should be one user (added with seeder) with the role of admin.

All authenticated users can post a discussion in a specific category. The categories are predefined (entered in the database with seeder): general, entertainment, sports, movies, politics and cars. The discussion should contain a title, a picture, a short description and who created it.

After a discussion is created, it isn't automatically available for other users to post, until the admin approves it. The admin should have a button to review all pending discussions. He can edit them (although he didn't create them) and can approve them.

After discussion is approved, it appears in the catalog of discussions and all visitors (authenticated and not authenticated) can open it to see the comments. Only authenticated users can post their own comments. Next to each comment show the time when it was created and who created it.

Each user can edit and delete only the discussions he created.

The admin can edit and delete all discussions.

Scoring:

1 point Migrations, models and relations.

3 points CRUD for the topics.

5 points Complete functionality.

Deadline:

One week after its presentation, 23:59h end of the day.
